

Receiving with ScanApp

The following documentation describes the daily receiving process for GM Dealers using **ScanApp**. **ScanApp** has been designed to work with DMS inventory orders, RIM orders and LPOs. Receiving *ALL* parts with **ScanApp** is essential to keeping data in order. Receiving parts and bypassing **ScanApp** will create reconciliation issues when using the invoice function and lowers the value of auditability for the dealer.

Generally, most dealers will receive the majority of their parts first thing in the morning. However, parts can also come in sporadically during the day. Dealers are encouraged to receive and finalize the morning receiving run and as parts arrive during the day, receive the parts in **ScanApp** and finalize the receipts at intervals that make the most sense. Be sure to finalize the day's receiving process before uploading the next day's Inventory Orders / Purchase Orders.

Receiving Instructions

1. **Scan Barcodes:** Using the Power Scan Gun scan each barcode on every package in the shipment. The Power Scan Gun will only recognize Canadian and American General Motors barcode labels. Any other barcode will not be scanned and will result in an audible error sound.
2. **Canadian and American Barcodes:**
 - *Canadian Barcodes:* Use the middle barcode on the General Motors shipping label.
 - *American Barcodes:* Use the middle and top barcodes on the General Motors shipping label, the codes can be scanned in any order.
3. **Parts without Bar Codes:** For shipments that arrive without a GM shipping label the receipt can be made using the "Manual Receipt" button on either the Power Scan Gun or on the **ScanApp** interface website.
4. **Quantities:** Be sure to use the quantity actually received when Receiving, not the quantity listed on the shipping label.
5. **Correcting Scans:** If quantities are entered incorrectly users change them directly on the Power Scan Gun by clicking on scan and changing the quantity. The last few scans can also be deleted if need directly on the Power Scan Gun.
6. **Split Shipments:** For split shipments, scan barcodes in the order shown on the labels. (e.g., 1 of 3, 2 of 3, etc.).

7. **Review Scans:** After scanning all incoming packages access the "Review Scans" section on the **ScanApp** website for a final review. Adjust quantities and delete records as needed. At this point users can re-scan labels if needed.
8. **Verify:** After review, select all visible scans by clicking the top left check box and clicking 'Selected All XXX'. Then click 'Verified Selected' and then confirm. All data will be moved to the Verified Scans section.
9. **Receipt Auditability:** All scan data will be accessible on the verified screen as long as the dealership runs **ScanApp**. All past receipts can be searched on the screen by changing the date parameters and adding in the text to search for. For example, to search for each receipt of part 87834163 change the date to the start and end date for searching and then enter the part number. Every instance of a receipt for the part will be shown on the screen.
10. **Power Receipt Report:** From the 'Verified Scans' section on the ScanApp website click the Power Receipt Report button which provides details on all receipts in the current data selection (generally just the current day, but users can select a wide range of dates to analyze if desired). The report is an Excel export.

The Power Receipt Report:

- Is used to identify parts received as Receiving in the Dealer's DMS.
- Shows receipts by DMS Order / Control number with line breaks between each.
- Allows easy review of Part and/or Quantity issues. To do so, click the drop down and uncheck the 'blank' option.
- Shows Customer Orders with a customer name and can assist parts sales staff with fulfilling the customer order quicker.
- Allows for easy review of part number supersessions.

Some dealers choose to email the report daily to all interested parties at the end of the receipt process.

Notes:

For the dealers that do not enter LPOs into their DMS parts system, the LPO receipts can still be done with **ScanApp** but will be flagged as "Received without Order".

For parts that have been superseded, a subscript S will be displayed by the part number in **ScanApp**.
