

ScanApp is an inbound inventory reconciliation and control system that provides real-time control over purchase order receipts, discrepancies, and inventory validation.

Data sources:

- DMS data export (Purchase Orders / Inventory Orders)
- OEM data (Virtual Packing Slip and Invoices)
- Receiving activity (physical part receipt)

Physical receipt is captured in real time and classified at the line level as:

- ✓ **Received as Ordered**
- ⚡ **Short Shipped**
- ⚡ **Over Shipped**
- ✗ **Shipped Without Order**
- ✗ **Not on Purchase Order**

Following receipt, invoice reconciliation is performed at the line level:

- Real-time line-item status updates
- Invoice validation prior to posting to accounting
- Journal entries prepared for accounting

Reporting:

- Power Shipped Report: expected inbound inventory
- Power Received Report: validated received inventory
- Power Invoice Report: invoiced inventory with real-time line-level receipt status

Key Outcomes:

- Reduces receiving time
- Enables earlier parts availability for technicians and customers
- Improves inventory accuracy and reliability
- Eliminates manual invoice reconciliation errors
- Identifies and prevents in-transit inventory loss

ScanApp eliminates manual receiving and reconciliation steps that are time-consuming and error-prone. The system validates inbound inventory against shipments and invoices, preventing payment for parts not received and improving inventory control.
